Study them as obstruction classes.

Let $E \xrightarrow{\pi} M$ be a (real) vector bundle of rk(E) = k.

The first Stiefel-Whitney class is a homomorphism $w_1(E): \pi_1(M) \to \mathbb{Z}/2\mathbb{Z}$ such that for $\gamma: [0,1] \to M \ \gamma(0) = \gamma(1)$ $w_1(E)([\gamma]) = 0 \quad \Leftrightarrow \quad \exists \{\{v_j(t)\}_{j=1}^k \mid \text{ continuous frame of } E_{\gamma(t)}\}$ with $v_j(0) = v_j(1)$ for all j.

Study them as obstruction classes.

Let $E \xrightarrow{\pi} M$ be a (real) vector bundle of rk(E) = k.

The first Stiefel-Whitney class is a homomorphism $w_1(E): \pi_1(M) \to \mathbb{Z}/2\mathbb{Z}$ such that for $\gamma: [0,1] \to M \ \gamma(0) = \gamma(1)$ $w_1(E)([\gamma]) = 0 \quad \Leftrightarrow \quad \exists \{\{v_j(t)\}_{j=1}^k \mid \text{ continuous frame of } E_{\gamma(t)}\}$ with $v_j(0) = v_j(1)$ for all j.

Equivalently, *E* is orientable over the closed loop γ iff $w_1(E)([\gamma]) = 0$. $\chi^{*} \not E \rightarrow (\circ \gamma) / \circ \gamma_1 \simeq S^{*}$

Study them as obstruction classes.

Let $E \xrightarrow{\pi} M$ be a (real) vector bundle of rk(E) = k.

The first Stiefel-Whitney class is a homomorphism $w_1(E): \pi_1(M) \to \mathbb{Z}/2\mathbb{Z}$ such that for $\gamma: [0,1] \to M \ \gamma(0) = \gamma(1)$ $w_1(E)([\gamma]) = 0 \quad \Leftrightarrow \quad \exists \{ \{v_j(t)\}_{j=1}^k \mid \text{ continuous frame of } E_{\gamma(t)} \}$ with $v_j(0) = v_j(1)$ for all j.

Equivalently, *E* is orientable over the closed loop γ iff $w_1(E)([\gamma]) = 0.$ In particular, *E* is orientable iff $w_1(E) = 0$.

Study them as obstruction classes.

Let $E \xrightarrow{\pi} M$ be a (real) vector bundle of rk(E) = k.

The first Stiefel-Whitney class is a homomorphism $w_1(E): \pi_1(M) \to \mathbb{Z}/2\mathbb{Z}$ such that for $\gamma: [0,1] \to M \ \gamma(0) = \gamma(1)$ $w_1(E)([\gamma]) = 0 \quad \Leftrightarrow \quad \exists \{\{v_j(t)\}_{j=1}^k \mid \text{ continuous frame of } E_{\gamma(t)}\}$ with $v_j(0) = v_j(1)$ for all j.

Equivalently, *E* is orientable over the closed loop γ iff $w_1(E)([\gamma]) = 0.$ In particular, *E* is orientable iff $w_1(E) = 0$.

Interpretation: Let $P \xrightarrow{\pi} M$ be the frame bundle of E. P is a principal $Gl(k; \mathbb{R})$ -bundle. Let $Gl^+(k; \mathbb{R}) \subset Gl(k; \mathbb{R})$ be the subgroup of matrices with positive determinant. There exists an $Gl^+(k, \mathbb{R})$ -bundle $Q \xrightarrow{\pi} M$ with a bundle map $\Phi : Q \rightarrow P$ such that $\Phi(qg) = \Phi(q)\rho(g)$ where $\rho(g) = g$ if and only if P is orientable or, equivalently, $w_1(E) = 0$.

Q is called **reduction** of *P* with respect to $\rho: Gl^+(k; \mathbb{R}) \to Gl(k; \mathbb{R})$.

Q is called **reduction** of *P* with respect to $\rho: Gl^+(k; \mathbb{R}) \to Gl(k; \mathbb{R})$.

Other examples: (i) For a euclidean vector bundle (E,g) the frame bundle of orthonormal frames of E is the reduction of the (general) frame bundle P w.r.t. $\rho: O(k) \hookrightarrow Gl(k; \mathbb{R})$.

Q is called **reduction** of *P* with respect to $\rho: Gl^+(k; \mathbb{R}) \to Gl(k; \mathbb{R})$.

Other examples: (i) For a euclidean vector bundle (E,g) the frame bundle of orthonormal frames of E is the reduction of the (general) frame bundle P w.r.t. $\rho: O(k) \hookrightarrow Gl(k; \mathbb{R})$.

(ii) For a complex vector bundle (E, J) the frame bundle of complex frames is the reduction of the of P w.r.t. $\rho: Gl(k; \mathbb{C}) \hookrightarrow Gl(2k; \mathbb{R}).$

(iii) For a unitary vector bundle (E, h) the frame bundle of unitary frames is the reduction of P w.r.t. $\rho : U(k) \hookrightarrow Gl(k; \mathbb{C})$.

Q is called **reduction** of *P* with respect to $\rho: Gl^+(k; \mathbb{R}) \to Gl(k; \mathbb{R})$.

Other examples: (i) For a euclidean vector bundle (E,g) the frame bundle of orthonormal frames of E is the reduction of the (general) frame bundle P w.r.t. $\rho: O(k) \hookrightarrow Gl(k; \mathbb{R})$.

(ii) For a complex vector bundle (E, J) the frame bundle of complex frames is the reduction of the of P w.r.t. $\rho: Gl(k; \mathbb{C}) \hookrightarrow Gl(2k; \mathbb{R})$.

(iii) For a unitary vector bundle (E, h) the frame bundle of unitary frames is the reduction of P w.r.t. $\rho : U(k) \hookrightarrow Gl(k; \mathbb{C})$.

(iv) What additional geometric structure belongs to a reduction of the unitary frame bundle w.r.t. $\rho: SU(k) \hookrightarrow {I\!\!\!/} U(k)$?

Q is called **reduction** of *P* with respect to $\rho: Gl^+(k; \mathbb{R}) \to Gl(k; \mathbb{R})$.

Other examples: (i) For a euclidean vector bundle (E,g) the frame bundle of orthonormal frames of E is the reduction of the (general) frame bundle P w.r.t. $\rho: O(k) \hookrightarrow Gl(k; \mathbb{R})$.

(ii) For a complex vector bundle (E, J) the frame bundle of complex frames is the reduction of the of P w.r.t. $\rho: Gl(k; \mathbb{C}) \hookrightarrow Gl(2k; \mathbb{R})$.

(iii) For a unitary vector bundle (E, h) the frame bundle of unitary frames is the reduction of P w.r.t. $\rho : U(k) \hookrightarrow Gl(k; \mathbb{C})$.

(iv) What additional geometric structure belongs to a reduction of the unitary frame bundle w.r.t. $\rho : SU(k) \hookrightarrow SU(k)$?

In general, ρ does not have to be injective nor jarjective, non-trivial $\rho: {\cal G} \to {\cal G}$ is possible.

(3) The corresponding geometric structure for such a reduction is very subtle, depends on parities of the rank. It has to to with representations of the Clifford algebra of (E, g). (4) $H^1(M; \mathbb{Z}/2\mathbb{Z}) = Hom(\pi_1(M); \mathbb{Z}/2\mathbb{Z})$ acts transitively and effectively on the set of spin structures in that is non-empty.

The 2nd Stiefel Whitney Class

Let $E \xrightarrow{\pi} M$ be a (real) oriented euclidean vector bundle of rk(E) = k.

 $w_2(E) \in H^2(M; \mathbb{Z}/2\mathbb{Z}).$

That means: $\overset{W}{\wp_2}(E)$ assigns to each immersion $\varphi: \Sigma \to M$ of a closed oriented surface an element in $\mathbb{Z}/2\mathbb{Z}$ so that it is additive under disjoint unions, invariant under homotopy, zero for the constant map and if $\Phi: V \to M$ is an immersion of a compact oriented 3 manifold with boundary, then $w_2(\Phi|_{\partial V}) = 0$.

The 2nd Stiefel Whitney Class $\frac{1}{5}$ $\frac{5}{5}$ $\frac{3}{5}$

Let $E \xrightarrow{\pi} M$ be a (real) oriented euclidean vector bundle of rk(E) = k. $w(E) \in H^2(M; \mathbb{Z}/2\mathbb{Z})$

 $w_2(E) \in H^2(M; \mathbb{Z}/2\mathbb{Z}).$

That means: $\omega_2(E)$ assigns to each immersion $\varphi : \Sigma \to M$ of a closed oriented surface an element in $\mathbb{Z}/2\mathbb{Z}$ so that it is additive under disjoint unions, invariant under homotopy, zero for the constant map and if $\Phi : V \to M$ is an immersion of a compact manifold with boundary, then $w_2(\Phi|_{\partial V}) = 0$.

We define $w_2(E)(\varphi) = 0$ if and only if the pull-back $\varphi^* E \xrightarrow{\pi} \Sigma$ admits a spin structure.

Then $\sigma \equiv 0$ outside a zero set.

Stahund & independent of Reimannian Schohre & can be formulahod for non-cruentable M

Corollary: Let $\sigma: M \to E$ be a section of a vector bundle over a manifold M. Assume σ is locally integrable (e.g. σ is continuous) and that for any smooth $\varphi: M \to E^*$ with compact support

$$\int_{M} \langle \varphi, \sigma \rangle dM = 0.$$

Then $\sigma \equiv 0$ outside a zero set.

This is often used in the following way: Assume *E* is equipped with a euclidean structure and fro any smooth $\tau : M \to E$ with compact support

$$\int_M g(\varphi, \sigma) dM = 0.$$

Then $\sigma \equiv 0$ outside a zero set.

The norm $\|.\|$ on $\Lambda^2(T_pM) \otimes \underline{\mathbf{g}}_p$ is defined by the euclidean structure induced by g and the Killing form.

The Yang-Mills Functional

Let *G* be a compact Lie group, $\langle ., . \rangle$ its positive definite killing form, i.e. a scalar product on its Lie algebra <u>*g*</u> which is invariant under conjugation with an element of *G*.

Let $P \xrightarrow{\pi} M$ be a principal *G*-bundle over the Riemannian manifold (M, g). The **Yang-Mills functional** assigns to each connection the energy of its curvature (the **field**):

$$A \in \mathcal{C}(P) \mapsto \mathcal{YM}(A) := \frac{1}{2} \int_M \|F_A\|^2 dM.$$

The norm ||.|| on $\Lambda^2(\mathcal{T}_p M) \otimes \underline{\mathbf{g}}_p$ is defined by the euclidean structure induced by g and the Killing form. Recall that $\mathcal{C}(P)$ is an affine space over $\Omega^1(M; \underline{\mathbf{g}})$ and that $F_{A+\underline{\mathbf{f}}\alpha} = F_A + D_A + \frac{1}{2} [\alpha, \alpha].$

We are intererested in extremal points. Necessary condition: For all $\alpha \in \Omega^1(M; \mathbf{g})$

We have

$$\begin{aligned} \frac{d}{2dt}\Big|_{t=0} \int_{M} \|F_{A} + tD_{A}\alpha + \frac{t^{2}}{2}[\alpha, \alpha]\|^{2} \\ &= \int_{M} \langle F_{A}, D_{A}\alpha \rangle + t\|D_{A}\alpha\|^{2} + \frac{3t^{2}}{2} \langle D_{A}\alpha, [\alpha, \alpha] \rangle + t^{3}\|[\alpha, \alpha]\|^{2} dM\Big|_{t=0} \\ &= \int_{M} \langle F_{A}, D_{A}\alpha \rangle dM. \end{aligned}$$

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

We are intererested in extremal points. Necessary condition: For all $\alpha \in \Omega^1(M; \mathbf{g})$

$$\frac{d}{dt}\Big|_{t=0}\mathcal{YM}(A+t\alpha)=0.$$

We have

$$\begin{split} \frac{d}{2dt}\Big|_{t=0} &\int_{M} \|F_{A} + tD_{A}\alpha + \frac{t^{2}}{2}[\alpha, \alpha]\|^{2} \\ &= \int_{M} \langle F_{A}, D_{A}\alpha \rangle + t\|D_{A}\alpha\|^{2} + \frac{3t^{2}}{2} \langle D_{A}\alpha, [\alpha, \alpha] \rangle + t^{3}\|[\alpha, \alpha]\|^{2} dM\Big|_{t=0} \\ &= \int_{M} \langle F_{A}, D_{A}\alpha \rangle dM. \end{split}$$

Now the last expression is equal to free free

Here

$$D^*_{\mathcal{A}}F_{\mathcal{A}}:=(-1)^{n-1}*D_{\mathcal{A}}*F_{\mathcal{A}}$$

with $n = \dim M$.

Here

$$D^*F_A:=(-1)^{n-1}*D_A*F_A$$

with $n = \dim M$. If A is extremal then

$$D_A \neq F_A = 0.$$

Connections satisfying this PDE are called **Yang-Mills** connections.

How about Minima? Let dim M = 4.

$$\begin{split} \|F_A \pm *F_A\|^2 dM &= \langle F_A \pm *F_A \wedge *(F_A \pm *F_A) \rangle \\ &= \langle F_A \pm *F_A \wedge \pm F_A + *F_A \rangle \\ &= \pm \langle F_A \wedge F_A \rangle \pm \langle *F_A \wedge *F_A \rangle + 2 \langle F_A \wedge *F_A \rangle \\ &= \pm 2 \langle F_A \wedge F_A \rangle + 2 \|F_A\|^2 dM \end{split}$$

Here

$$D^*F_A := (-1)^{n-1} * D_A * F_A$$

with $n = \dim M$. If A is extremal then

$$D_A * F_A = 0.$$

Connections satisfying this PDE are called **Yang-Mills** connections.

How about Minima? Let dim M = 4.

$$\begin{split} \|F_A \pm *F_A\|^2 dM &= \langle F_A \pm *F_A \wedge *(F_A \pm *F_A) \rangle \\ &= \langle F_A \pm *F_A \wedge \pm F_A + *F_A \rangle \\ &= \pm \langle F_A \wedge F_A \rangle \pm \langle *F_A \wedge *F_A \rangle + 2 \langle F_A \wedge *F_A \rangle \\ &= \pm 2 \langle F_A \wedge F_A \rangle + 2 \|F_A\|^2 dM \end{split}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

We obtain

$$\frac{1}{2}\int \|F_A\|^2 dM \geq \pm \frac{1}{2}\int_M \langle F_A \wedge F_A \rangle$$

We obtain

$$rac{1}{2}\int \|F_A\|^2 dM \geq \pm rac{1}{2}\int_M \langle F_A \wedge F_A
angle$$

Based on ADHM-construction and BPST-instantons one can explicitely construct all anti self dual connections on the quaternionic Hopf bundle over S^4 (see Freed,Uhlenbeck: Instantons and Four-Manifolds. Springer 1991).

Gauge Theory

Let $P \xrightarrow{\pi} M$ be a principal *G*-bundle for a Lie group G. Consider the associated group bundle $P \times_{\alpha} G = P \times G / \sim$ with the equivalence given by the *G*-action

$$(p,h) \sim (pg,g^{-1}hg).$$

$$(p,h)\sim (pg,g^{-1}hg).$$

Sections $\mathcal{G}(P) := Gamma(M, P \times_{\alpha} G)$ are called **gauge** transformations.

They act on the space of connections:

$$(A,g) \in \mathcal{C}(P) \times \mathcal{G}(P) \mapsto g^{-1}Ag + g^{-1}dg.$$

One studies the moduli space of anti self dual connections

$$\mathcal{M}(P) := \{A \in \mathcal{C}(P) \mid F_A = -*F_A\}/\mathcal{G}(P).$$

For generic Riemannian metric on M, $c_1(P) = 0$ (so-called SU(2)-bundle) the subspace of irreducible connections is a manifold of dimension

$$\dim \mathcal{M}^*(P) = 8c_2(P) - 3(1 - b_1(M) + b_+(M)).$$

The topology of $\mathcal{M}(P)$ which is invariant under cobordisms gives rise to obtructions and invariants of 3- and 4-dimensional manifolds.

The topology of $\mathcal{M}(P)$ which is invariant under cobordisms gives rise to obtructions and invariants of 3- and 4-dimensional manifolds.

Examples: (i) If the intersection form of a simply connected closed 4-manifold (i.e. the bilinear form on $H^2_{DR}(M)$ discussed earlier) is definite it is diagonalizable over \mathbb{Z} .

Remark: In 1994 a new type of field equations, **Seiberg-Witten** equations would reprove these and often give much stronger results. However, Donaldson theory is still around...
