## Minimal Surfaces

Let  $C \subset \mathbb{R}^3$  be a disjoint union of  $k$  simple closed curves. Let  $F$  be compact surface with  $k$  boundary components.

# Minimal Surfaces

Let  $C \subset \mathbb{R}^3$  be a disjoint union of  $k$  simple closed curves. Let  $F$  be compact surface with  $k$  boundary components.

Consider the functional

$$u \in \mathcal{B} := \{u : F \rightarrow \mathbb{R}^3 \mid u \text{ immersion, } u|_{\partial F} : \partial F \rightarrow C \text{ diffeo}\}$$

$$\mapsto \text{area}(u) \in (0, \infty)$$

$$\int_F d(u(F)) \text{, locally in coordinates}$$
$$d(u(F)) = \sqrt{\det(g_{ij}(x))} dx_1 dx_2$$
$$g_{ij}(x) = \left\langle \frac{\partial u}{\partial x_i}, \frac{\partial u}{\partial x_j} \right\rangle$$

# Minimal Surfaces

Let  $C \subset \mathbb{R}^3$  be a disjoint union of  $k$  simple closed curves. Let  $F$  be compact surface with  $k$  boundary components.

Consider the functional

$$u \in \mathcal{B} := \{u : F \rightarrow \mathbb{R}^3 \mid u \text{ immersion, } u|_{\partial F} : \partial F \rightarrow C \text{ diffeo}\} \\ \mapsto \text{area}(u) \in (0, \infty)$$

For a smooth family  $\{u_t\}_{t \in (-\epsilon, \epsilon)} \subset \mathcal{B}$ ,  $\epsilon > 0$

$$X := \left. \frac{d}{dt} \right|_{t=0} u_t : F \rightarrow \mathbb{R}^3$$

is a vector field along  $u_0$  with  $X_p \in T_p C$  for all  $p \in \partial F$ .

# Minimal Surfaces

Let  $C \subset \mathbb{R}^3$  be a disjoint union of  $k$  simple closed curves. Let  $F$  be compact surface with  $k$  boundary components.

Consider the functional

$$u \in \mathcal{B} := \{u : F \rightarrow \mathbb{R}^3 \mid u \text{ immersion, } u|_{\partial F} : \partial F \rightarrow C \text{ diffeo}\} \\ \mapsto \text{area}(u) \in (0, \infty)$$

For a smooth family  $\{u_t\}_{t \in (-\epsilon, \epsilon)} \subset \mathcal{B}$ ,  $\epsilon > 0$

$$X := \left. \frac{d}{dt} \right|_{t=0} u_t : F \rightarrow \mathbb{R}^3$$

is a vector field along  $u_0$  with  $X_p \in T_p C$  for all  $p \in \partial F$ .

**Proposition 82:** With the notation as above

$$\left. \frac{d}{dt} \right|_{t=0} \text{area}(u_t) = -2 \int_F \langle X, \mathcal{H} \rangle d(u_0(F))$$

where  $d(u_0(F))$  is the area measure of  $u_0(F)$  and  $\mathcal{H}$  its mean curvature vector.

Define in a coord. w.bhd

$$N = \frac{\frac{\partial u}{\partial x_1} \times \frac{\partial u}{\partial x_2}}{\left\| \frac{\partial u}{\partial x_1} \times \frac{\partial u}{\partial x_2} \right\|}$$

$\lambda_1, \lambda_2$  eigenvalues of  $\mathcal{H}$

$$\mathcal{H} := \left( \frac{\lambda_1 + \lambda_2}{2} \right) \cdot N$$

unchanged under  $N \mapsto -N$

# Minimal Surfaces

In particular, if  $u_0$  is minimal, then

$$\mathcal{H} \equiv 0. \quad \left( \begin{array}{l} \text{fundamental Lemma} \\ \text{of Calculus of Variations} \end{array} \right)$$

*Remark:* Immersed surfaces with  $\mathcal{H} \equiv 0$  are called **minimal surfaces** - even if they have infinite area.

# Minimal Surfaces

In particular, if  $u_0$  is minimal, then

$$\mathcal{H} \equiv 0.$$

*Remark:* Immersed surfaces with  $\mathcal{H} \equiv 0$  are called **minimal surfaces** - even if they have infinite area.

*Proof:* (i) Notice for all  $p$

$$u_t(p) = u_0(p) + tX_p + O(t, p)$$

where  $\partial_t O(t, p)|_{t=0} = 0$ .

# Minimal Surfaces

In particular, if  $u_0$  is minimal, then

$$\mathcal{H} \equiv 0.$$

*Remark:* Immersed surfaces with  $\mathcal{H} \equiv 0$  are called **minimal surfaces** - even if they have infinite area.

*Proof:* (i) Notice for all  $p$

$$u_t(p) = u_0(p) + tX_p + O(t, p)$$

where  $\partial_t O(t, p)|_{t=0} = 0$ . First fundamental form depends smoothly on  $t$ .

# Minimal Surfaces

In particular, if  $u_0$  is minimal, then

$$\mathcal{H} \equiv 0.$$

*Remark:* Immersed surfaces with  $\mathcal{H} \equiv 0$  are called **minimal surfaces** - even if they have infinite area.

*Proof:* (i) Notice for all  $p$

$$u_t(p) = u_0(p) + tX_p + O(t, p)$$

where  $\partial_t O(t, p)|_{t=0} = 0$ . First fundamental form depends smoothly on  $t$ .

For  $\tilde{u}_t = u_0 + tX$  for  $t$  small

$$\left. \frac{d}{dt} \right|_{t=0} (\text{area}(u_t) - \text{area}(\tilde{u}_t)) = 0.$$

# Minimal Surfaces

In particular, if  $u_0$  is minimal, then

$$\mathcal{H} \equiv 0.$$

*Remark:* Immersed surfaces with  $\mathcal{H} \equiv 0$  are called **minimal surfaces** - even if they have infinite area.

*Proof:* (i) Notice for all  $p$

$$u_t(p) = u_0(p) + tX_p + O(t, p)$$

where  $\partial_t O(t, p)|_{t=0} = 0$ . First fundamental form depends smoothly on  $t$ .

For  $\tilde{u}_t = u_0 + tX$  for  $t$  small

$$\left. \frac{d}{dt} \right|_{t=0} (\text{area}(u_t) - \text{area}(\tilde{u}_t)) = 0.$$

Replace  $u$  by  $u = u_0 + tX$ .

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.

$$X_p^N = 0 \quad \forall p \in \partial F$$

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.  $X^N, X^T$  are smooth vector fields along  $u_0$ .

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.  $X^N, X^T$  are smooth vector fields along  $u_0$ .

$\xi$  is a vector field on  $F$ ,  $\xi_p \in T(\partial F)$  for  $p \in \partial F$ .

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt}\Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt}\Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt}\Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.  $X^N, X^T$  are smooth vector fields along  $u_0$ .

$\xi$  is a vector field on  $F$ ,  $\xi_p \in T(\partial F)$  for  $p \in \partial F$ .

Hence its flow  $\Phi_t : F \rightarrow F$  is defined and a diffeomorphism.

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.  $X^N, X^T$  are smooth vector fields along  $u_0$ .

$\xi$  is a vector field on  $F$ ,  $\xi_p \in T(\partial F)$  for  $p \in \partial F$ .

Hence its flow  $\Phi_t : F \rightarrow F$  is defined and a diffeomorphism.

$$\frac{d}{dt} \Big|_{t=0} u_0 \circ \Phi_t = du_0(\xi) = X^T$$

## Minimal Surfaces

(ii) Let  $X_1, X_2$  be two vector fields along  $u_0$  as above. Then by chain rule

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + t(X_1 + X_2)) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_1) + \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX_2).$$

(iii) Let  $X_p = X_p^T + X_p^N$  such that  $X_p^T = d_p u_0(\xi)$  for  $\xi \in T_p F$  and  $X_p^N \perp d_p u_0(T_p F)$  the splitting into tangent and normal part.  $X^N, X^T$  are smooth vector fields along  $u_0$ .

$\xi$  is a vector field on  $F$ ,  $\xi_p \in T(\partial F)$  for  $p \in \partial F$ .

Hence its flow  $\Phi_t : F \rightarrow F$  is defined and a diffeomorphism.

$$\frac{d}{dt} \Big|_{t=0} u_0 \circ \Phi_t = du_0(\xi) = X^T$$

and

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX^T) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 \circ \Phi_t) = 0.$$

*invariant under reparametrization*  
 $\Phi_t$

# Minimal Surfaces

Hence

$$\left. \frac{d}{dt} \right|_{t=0} \text{area}(u_0 + tX) = \left. \frac{d}{dt} \right|_{t=0} \text{area}(u_0 + tX^N).$$

# Minimal Surfaces

Hence

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX^N).$$

From now on, assume  $X_p \perp d_p(T_p F)$ .

# Minimal Surfaces

Hence

$$\frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX) = \frac{d}{dt} \Big|_{t=0} \text{area}(u_0 + tX^N).$$

From now on, assume  $X_p \perp d_p(T_p F)$ .

(iv) Using partition of unity we can write  $X = X_1 + X_2 + \dots + X_k$  where  $\text{supp}(X_j) \subset U_j$  for a coordinate neighbourhood  $U_j$  of  $F$ .

# Minimal Surfaces

Hence

$$\left. \frac{d}{dt} \right|_{t=0} \text{area}(u_0 + tX) = \left. \frac{d}{dt} \right|_{t=0} \text{area}(u_0 + tX^N).$$

From now on, assume  $X_p \perp d_p(T_p F)$ .

(iv) Using partition of unity we can write  $X = X_1 + X_2 + \dots + X_k$  where  $\text{supp}(X_j) \subset U_j$  for a coordinate neighbourhood  $U_j$  of  $F$ .

Thus, suppose  $\text{supp}(X) \subset U$ ,  $(U, \varphi, V)$  coordinate chart of  $F$ . Let  $N$  be the unit normal field and

$$X = fN$$

for  $f : U \rightarrow \mathbb{R}$ .

# Minimal Surfaces

In coordinates  $(x_1, x_2) \in V$

$$u_t = u_0 + t \underline{f} N$$

$$\begin{aligned} g_{ij}(t) &:= \left\langle \frac{\partial u_t}{\partial x_i}, \frac{\partial u_t}{\partial x_j} \right\rangle \\ &= g_{ij}(0) + t \left( \frac{\partial f}{\partial x_j} \left\langle \frac{\partial u_0}{\partial x_i}, N \right\rangle + \frac{\partial f}{\partial x_i} \left\langle \frac{\partial u_0}{\partial x_j}, N \right\rangle \right) \\ &\quad + \underline{tf} \left( \left\langle \frac{\partial u_0}{\partial x_i}, \frac{\partial N}{\partial x_j} \right\rangle + \left\langle \frac{\partial u_0}{\partial x_j}, \frac{\partial N}{\partial x_i} \right\rangle \right) + O(t^2) \\ &= \underline{g_{ij}(0)} - 2tfh_{ij} + O(t^2) \\ &= \sum_{k=1}^2 (\delta_i^k - 2tfw_i^k + O(t^2)) g_{kj}. \end{aligned}$$

$$\downarrow T_{u_0(p)} u_0(F) \perp N_p$$

where  $(h_{ij})$  is the second fundamental form and  $(w_i^k)$  is the Weingarten map of  $u_0$ .

# Minimal Surfaces

In coordinates  $(x_1, x_2) \in V$

$$\begin{aligned}g_{ij}(t) &:= \left\langle \frac{\partial u_t}{\partial x_i}, \frac{\partial u_t}{\partial x_j} \right\rangle \\&= g_{ij}(0) + t \left( \frac{\partial f}{\partial x_j} \left\langle \frac{\partial u_0}{\partial x_i}, N \right\rangle + \frac{\partial f}{\partial x_i} \left\langle \frac{\partial u_0}{\partial x_j}, N \right\rangle \right) \\&\quad + t^2 \left( \left\langle \frac{\partial u_0}{\partial x_i}, \frac{\partial N}{\partial x_j} \right\rangle + \left\langle \frac{\partial u_0}{\partial x_j}, \frac{\partial N}{\partial x_i} \right\rangle \right) + O(t^2) \\&= g_{ij}(0) - 2t f h_{ij} + O(t^2) \\&= \sum_{k=1}^2 (\delta_i^k - 2t f w_i^k + O(t^2)) g_{kj}.\end{aligned}$$

where  $(h_{ij})$  is the second fundamental form and  $(w_i^k)$  is the Weingarten map of  $u_0$ .  $W_p = T_p F \rightarrow T_p F$

Recall  $\text{Trace}(W) = 2H$ .

## Minimal Surfaces

In coordinates  $(x_1, x_2) \in V$

$$\begin{aligned}g_{ij}(t) &:= \left\langle \frac{\partial u_t}{\partial x_i}, \frac{\partial u_t}{\partial x_j} \right\rangle \\&= g_{ij}(0) + t \left( \frac{\partial f}{\partial x_j} \left\langle \frac{\partial u_0}{\partial x_i}, N \right\rangle + \frac{\partial f}{\partial x_i} \left\langle \frac{\partial u_0}{\partial x_j}, N \right\rangle \right) \\&\quad + tf \left( \left\langle \frac{\partial u_0}{\partial x_i}, \frac{\partial N}{\partial x_j} \right\rangle + \left\langle \frac{\partial u_0}{\partial x_j}, \frac{\partial N}{\partial x_i} \right\rangle \right) + O(t^2) \\&= g_{ij}(0) - 2tfh_{ij} + O(t^2) \\&= \sum_{k=1}^2 (\delta_i^k - 2tfw_i^k + O(t^2))g_{kj}.\end{aligned}$$

where  $(h_{ij})$  is the second fundamental form and  $(w_i^k)$  is the Weingarten map of  $u_0$ .

Recall  $\text{Trace}(W) = 2H$ . Hence

$$\begin{aligned}\det(g_{ij}(t)) &= \det(g_{ij}(0)(1 - 2tf\text{Trace}(w_i^k) + O(t^2))) \\&= \det(g_{ij}(0))(1 - 4tfH). + O(t^2)\end{aligned}$$

# Minimal Surfaces

$$\sqrt{1+t} = 1 + \frac{t}{2} + o(t^2)$$

Thus

$$\left. \frac{d}{dt} \right|_{t=0} \sqrt{\det(g_{ij}(t))} = \sqrt{\det(g_{ij}(0))}(-2fH).$$

# Minimal Surfaces

Thus

$$\frac{d}{dt} \Big|_{t=0} \sqrt{\det(g_{ij}(t))} = \sqrt{\det(g_{ij}(0))} (-2fH).$$

Finally,

$$\begin{aligned} \frac{d}{dt} \Big|_{t=0} \text{area}(u_t) &= -2 \int_F fH d(u_0(F)) \\ &= \frac{d}{dt} \Big|_{t=0} \int_k \sqrt{\det(g_{ij}(t))} dx_1 dx_2 = \int_k -2fH \sqrt{\det(g_{ij}(0))} dx_1 dx_2 \\ &= -2 \int_F \langle fN, HN \rangle d(u_0(F)) \\ &= -2 \int_F \langle X, \mathcal{H} \rangle d(u_0(F)) \quad \square \end{aligned}$$

# Lagrangian Mechanics

Let  $M$  be a smooth manifold (the **configuration space**). Let

$$L : TM \times \mathbb{R} \rightarrow \mathbb{R}$$

be a smooth function. If  $L$  is constant on  $\mathbb{R}$  it is called **autonomous**.

# Lagrangian Mechanics

Let  $M$  be a smooth manifold (the **configuration space**). Let

$$L : TM \times \mathbb{R} \rightarrow \mathbb{R}$$

be a smooth function. If  $L$  is constant on  $\mathbb{R}$  it is called **autonomous**.

*Examples:* (i)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$ .  $V$  is the **potential energy**  $\frac{m \|v\|^2}{2}$  is the **kinetic energy** of the system. The equation of motion is Newton's equation.

# Lagrangian Mechanics

Let  $M$  be a smooth manifold (the **configuration space**). Let

$$L : TM \times \mathbb{R} \rightarrow \mathbb{R}$$

be a smooth function. If  $L$  is constant on  $\mathbb{R}$  it is called **autonomous**.

*Examples:* (i)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$ .  $V$  is the **potential energy**  $\frac{m}{2} \|v\|^2$  is the **kinetic energy** of the system. The equation of motion is Newton's equation.  $\dot{x} \in T_x M$

(ii) Let  $(M, g)$  be a Riemannian manifold,  $L(x, \dot{x}) := \frac{1}{2} \|\dot{x}\|_{g(x)}^2$  - is the system of a free mass point: no forces are acting on it. The equation of motion is the geodesic equation.

# Lagrangian Mechanics

The state of a point mass at time  $t_0$  is described<sup>Sc</sup> by location and velocity:  $(x_0, v_0)$ . Its dynamics is described as the Extrema of the Lagrange functional:  $\gamma : [a, b] \rightarrow M$

$$\mathcal{L}(\gamma) := \int_a^b L(\gamma(t), \dot{\gamma}(t), t) dt.$$

among all differentiable curves  $\gamma : [a, b] \rightarrow M$  with fixed endpoints  $\gamma(a) = x_0$  and  $\gamma(b) = x_1$ .

# Lagrangian Mechanics

The state of a point mass at time  $t_0$  is described by location and velocity:  $(x_0, v_0)$ . Its dynamics is described as the Extrema of the Lagrange functional:  $\gamma : [a, b] \rightarrow M$

$$\mathcal{L}(\gamma) := \int_a^b L(\gamma(t), \dot{\gamma}(t), t) dt.$$

among all differentiable curves  $\gamma : [a, b] \rightarrow M$  with fixed endpoints  $\gamma(a) = x_0$  and  $\gamma(b) = x_1$ .

To describe its extremal points let  $\xi$  be a smooth vector field along  $\gamma$  which vanishes at  $t = a, b$  and  $\{\gamma_\tau : [a, b] \rightarrow M\}_{\tau \in (-\epsilon, \epsilon)}$  smooth family,  $\gamma_\tau(a) = x_0$  and  $\gamma_\tau(b) = x_1$  for all  $\tau$  with

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \gamma_\tau = \xi.$$

# Lagrangian Mechanics

We need to compute the first variation.

**Lemma 83:** There is an smooth section  $X_{L,\gamma} \in \Gamma(\gamma^* T^* M)$  such that

$$\frac{d}{dt} \Big|_{t=0} \mathcal{L}(\gamma_t) =: d_\gamma \mathcal{L}(\xi) = \int_a^b X_{L,\gamma}(\xi)(t) dt.$$

for all smooth vectorfields  $\xi$  along  $\gamma$ .

The proof usually starts with the remark that it suffices to consider  $\xi$  with support in a coordinate neighbourhood of a chart  $(U, \varphi, V)$  of  $M$  (as we have done for minimal surfaces). In such coordinates one shows that

$$X_{L,\gamma}(t) = \sum_{j=1}^n \left( \frac{\partial L}{\partial x_j}(\gamma(t), \dot{\gamma}(t), t) - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}_j}(\gamma(t), \dot{\gamma}(t), t) \right) \right) dx^j.$$

# Lagrangian Mechanics

We need to compute the first variation.

**Lemma 83:** There is an smooth section  $X_{L,\gamma} \in \Gamma(\gamma^* T^*M)$  such that

$$d_\gamma \mathcal{L}(\xi) = \int_a^b X_{L,\gamma}(\xi)(t) dt. \leftarrow \text{pull-back bundle over } [a,b]$$

for all smooth vectorfields  $\xi$  along  $\gamma$ .  $\in T\gamma$

The proof usually starts with the remark that it suffices to consider  $\xi$  with support in a coordinate neighbourhood of a chart  $(U, \varphi, V)$  of  $M$  (as we have done for minimal surfaces). In such coordinates one shows that

$$T^*M \ni X_{L,\gamma}(t) = \sum_{j=1}^n \left( \frac{\partial L}{\partial x_j}(\gamma(t), \dot{\gamma}(t), t) - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}_j}(\gamma(t), \dot{\gamma}(t), t) \right) \right) dx^j.$$

Hence if  $\gamma$  is extremal it implies the **Euler-Lagrange equations** which in local coordinates are given as

$$\frac{\partial L}{\partial x_j}(\gamma(t), \dot{\gamma}(t), t) - \frac{d}{dt} \left( \frac{\partial L}{\partial \dot{x}_j}(\gamma(t), \dot{\gamma}(t), t) \right) = 0 \quad \leftarrow$$

for all  $j = 1, \dots, n$ .

# Lagrangian Mechanics

$$\frac{m}{2} (v_1^2 + v_2^2 + v_3^2)$$

*Examples:* (1)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$  ( $v = \dot{x}$ ). The Euler-Lagrange equations boil down to

$$\frac{d}{dt}(m\dot{\gamma}) = -\nabla V(\gamma(t)),$$

Newton's equations of classical mechanics.

## Lagrangian Mechanics

*Examples:* (1)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$  ( $v = \dot{x}$ ). The Euler-Lagrange equations boil down to

$$\frac{d}{dt}(m\dot{\gamma}) = -\nabla V(\gamma(t)),$$

Newton's equations of classical mechanics.

(2) In local coordinates  $L(x, \dot{x}) = \frac{1}{2} \|\dot{x}\|_{g(x)}^2 = \frac{1}{2} \sum_{i,j=1}^n g_{ij}(x) \dot{x}^i \dot{x}^j$ .

## Lagrangian Mechanics

Examples: (1)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$  ( $v = \dot{x}$ ). The Euler-Lagrange equations boil down to

$$\frac{d}{dt}(m\dot{\gamma}) = -\nabla V(\gamma(t)),$$

Newton's equations of classical mechanics.

(2) In local coordinates  $L(x, \dot{x}) = \frac{1}{2} \|\dot{x}\|_{g(x)}^2 - V(x) = \frac{1}{2} \sum_{i,j=1}^n g_{ij}(x) \dot{x}^i \dot{x}^j$ .

Hence the Euler-Lagrange-equations become

$$\sum_{ij=1}^n \frac{\partial g_{ij}}{\partial x_k}(\gamma(t)) \dot{\gamma}_i(t) \dot{\gamma}_j(t) - 2 \frac{d}{dt} (g_{ij}(\gamma(t)) \dot{\gamma}_j(t)) = 0$$

for all  $k = 1, \dots, n$ , i.e. the geodesic equations!  $\ddot{\gamma}_k \llcorner = \sum \Gamma_{ij}^k \dot{\gamma}_i \dot{\gamma}_j$

## Lagrangian Mechanics

*Examples:* (1)  $M = \mathbb{R}^3$ ,  $L(x, v) = \frac{m}{2} \|v\|^2 - V(x)$  ( $v = \dot{x}$ ). The Euler-Lagrange equations boil down to

$$\frac{d}{dt}(m\dot{\gamma}) = -\nabla V(\gamma(t)),$$

Newton's equations of classical mechanics.

(2) In local coordinates  $L(x, \dot{x}) = \frac{1}{2} \|\dot{x}\|_{g(x)}^2 = \frac{1}{2} \sum_{i,j=1}^n g_{ij}(x) \dot{x}^i \dot{x}^j$ .

Hence the Euler-Lagrange-equations become

$$\sum_{ij=1}^n \frac{\partial g_{ij}}{\partial x_k}(\gamma(t)) \dot{\gamma}_i(t) \dot{\gamma}_j(t) - 2 \frac{d}{dt} g_{ij}(\gamma(t)) \dot{\gamma}_j(t) = 0$$

for all  $k = 1, \dots, n$ , i.e. the geodesic equations!

A global formulation is given by

$$(\nabla_{\dot{\gamma}} \dot{\gamma}) = \nabla_{\frac{d}{dt}}^{\gamma} \dot{\gamma} = 0.$$

# The Euler-Lagrange Equations

We derive a global formulation of general Euler-Lagrange-equations. We have:

$$\begin{aligned}d_{\gamma}\mathcal{L}(\xi) &= \frac{d}{d\tau}\Big|_{\tau=0} \int_a^b L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b \frac{d}{d\tau}\Big|_{\tau=0} L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t\left(\frac{d}{d\tau}\Big|_{\tau=0} \dot{\gamma}_{\tau}(t)\right) dt.\end{aligned}$$

where  $L_t : TM \times \mathbb{R} \rightarrow \mathbb{R}$  is  $L_t(x, v) := L(x, v, t)$ .

# The Euler-Lagrange Equations

We derive a global formulation of general Euler-Lagrange-equations. We have:

$$\begin{aligned}d_{\gamma}\mathcal{L}(\xi) &= \left. \frac{d}{d\tau} \right|_{\tau=0} \int_a^b L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b \left. \frac{d}{d\tau} \right|_{\tau=0} L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_{\tau}(t) \right) dt.\end{aligned}$$

where  $L_t : TM \times \mathbb{R} \rightarrow \mathbb{R}$  is  $L_t(x, v) := L(x, v, t)$ . What is

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_{\tau}(t) \in T_{(\gamma(t), \dot{\gamma}(t))} TM \quad ?$$

# The Euler-Lagrange Equations

We derive a global formulation of general Euler-Lagrange-equations. We have:

$$\begin{aligned}d_{\gamma} \mathcal{L}(\xi) &= \frac{d}{d\tau} \Big|_{\tau=0} \int_a^b L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b \frac{d}{d\tau} \Big|_{\tau=0} L(\gamma_{\tau}(t), \dot{\gamma}_{\tau}(t), t) dt \\ &= \int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \frac{d}{d\tau} \Big|_{\tau=0} \dot{\gamma}_{\tau}(t) \right) dt.\end{aligned}$$

where  $L_t : TM \times \mathbb{R} \rightarrow \mathbb{R}$  is  $L_t(x, v) := L(x, v, t)$ . What is

$$\frac{d}{d\tau} \Big|_{\tau=0} \dot{\gamma}_{\tau}(t) \in T_{(\gamma(t), \dot{\gamma}(t))} TM \quad ?$$

Fix a connection  $\nabla$  on  $TM \xrightarrow{\pi} M$ . Recall for the smooth map  $\pi : TM \rightarrow M$

$$d_{(\gamma(t), \dot{\gamma}(t))} \pi \left( \frac{d}{d\tau} \Big|_{\tau=0} \dot{\gamma}_{\tau}(t) \right) = \frac{d}{d\tau} \Big|_{\tau=0} (\pi(\dot{\gamma}_{\tau}(t))) = \frac{d}{d\tau} \Big|_{\tau=0} \gamma_{\tau}(t) = \xi(t).$$

# The Euler-Lagrange Equations

With the isomorphism  $(d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} : T_{\gamma(t)} M \rightarrow T_{(\gamma(t), \dot{\gamma}(t))}^h TM$

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

# The Euler-Lagrange Equations

With the isomorphism  $(d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} : T_{\gamma(t)} M \rightarrow T_{(\gamma(t), \dot{\gamma}(t))}^h TM$

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

We get

$$\begin{aligned} & d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) \right) \\ &= d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) \right) + d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right). \end{aligned}$$

# The Euler-Lagrange Equations

With the isomorphism  $(d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} : T_{\gamma(t)} M \rightarrow T_{(\gamma(t), \dot{\gamma}(t))}^h TM$

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

We get

$$\begin{aligned} & d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) \right) \\ &= d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) \right) + d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right). \end{aligned}$$

We identified  $T_{(x, v)}(T_x M) \cong T_x M$ .

# The Euler-Lagrange Equations

With the isomorphism  $(d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} : T_{\gamma(t)} M \rightarrow T_{(\gamma(t), \dot{\gamma}(t))}^h TM$

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

We get

$$\begin{aligned} & d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) \right) \\ &= d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) \right) + d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right). \end{aligned}$$

We identified  $T_{(x,v)}(T_x M) \cong T_x M$ .

Partial integration yields

$$\int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right) dt = - \int_a^b \nabla_{\frac{d}{dt}}^\gamma (d_{(\gamma(t), \dot{\gamma}(t))}^\vee L_t)(\xi(t)) dt,$$

# The Euler-Lagrange Equations

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

We get

$$\begin{aligned} & d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) \right) \\ &= d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) \right) + d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right). \end{aligned}$$

We identified  $T_{(x, v)}(T_x M) \cong T_x M$ .

Partial integration yields

$$\int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right) dt = - \int_a^b \nabla_{\frac{d}{dt}}^\gamma (d_{(\gamma(t), \dot{\gamma}(t))}^\vee L_t)(\xi(t)) dt,$$

where  $d_{(\gamma(t), \dot{\gamma}(t))}^\vee L_t = d_{(\gamma(t), \dot{\gamma}(t))} L_t \Big|_{T_{(\gamma(t), \dot{\gamma}(t))}(T_{\gamma(t)} M)} \in T_{\gamma(t)}^* M$ ,

# The Euler-Lagrange Equations

With the isomorphism  $(d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} : T_{\gamma(t)} M \rightarrow T_{(\gamma(t), \dot{\gamma}(t))}^h TM$

$$\left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) - (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) = \nabla_{\frac{d}{dt}}^\gamma \xi(t).$$

We get

$$\begin{aligned} & d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \left. \frac{d}{d\tau} \right|_{\tau=0} \dot{\gamma}_\tau(t) \right) \\ &= d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1}(\xi(t)) \right) + d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right). \end{aligned}$$

We identified  $T_{(x, v)}(T_x M) \cong T_x M$ .

Partial integration yields

$$\int_a^b d_{(\gamma(t), \dot{\gamma}(t))} L_t \left( \nabla_{\frac{d}{dt}}^\gamma \xi(t) \right) dt = - \int_a^b \nabla_{\frac{d}{dt}}^\gamma (d_{(\gamma(t), \dot{\gamma}(t))}^\vee L_t)(\xi(t)) dt,$$

where  $d_{(\gamma(t), \dot{\gamma}(t))}^\vee L_t = d_{(\gamma(t), \dot{\gamma}(t))} L_t \Big|_{T_{(\gamma(t), \dot{\gamma}(t))}(T_{\gamma(t)} M)} \in T_{\gamma(t)}^* M$ , the covariant derivative applied to it is the one induced by  $\nabla^\gamma$  and we make use of  $\xi(a) = \xi(b) = 0$ .

# The Euler-Lagrange Equations

We end up with

$$d_{\gamma} \mathcal{L}(\xi) = \int_a^b \left( d_{(\gamma(t), \dot{\gamma}(t))} L_t \circ (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} - \nabla_{\frac{d}{dt}}^{\gamma} (d_{(\gamma(t), \dot{\gamma}(t))}^{\vee} L_t) \right) (\xi(t)) dt$$

which has to vanish for all  $\xi$ .

# The Euler-Lagrange Equations

We end up with

$$d_{\gamma} \mathcal{L}(\xi) = \int_a^b \left( d_{(\gamma(t), \dot{\gamma}(t))} L_t \circ (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} - \nabla_{\frac{d}{dt}}^{\gamma} (d_{(\gamma(t), \dot{\gamma}(t))}^{\vee} L_t) \right) (\xi(t)) dt$$

which has to vanish for all  $\xi$ .

**Proposition 84:** An extremal path  $\gamma : [a, b] \rightarrow M$  in the space of all such maps with the same endpoints  $\gamma(a) = x_0$  and  $\gamma(b) = x_1$  satisfies the Euler-Lagrange equations

$$d_{(\gamma(t), \dot{\gamma}(t))} L_t \circ (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} - \nabla_{\frac{d}{dt}}^{\gamma} (d_{(\gamma(t), \dot{\gamma}(t))}^{\vee} L_t) = 0.$$

# The Euler-Lagrange Equations

We end up with

$$d_{\gamma} \mathcal{L}(\xi) = \int_a^b \left( d_{(\gamma(t), \dot{\gamma}(t))} L_t \circ (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} - \nabla_{\frac{d}{dt}}^{\gamma} (d_{(\gamma(t), \dot{\gamma}(t))}^{\vee} L_t) \right) (\xi(t)) dt$$

which has to vanish for all  $\xi$ .

**Proposition 84:** An extremal path  $\gamma : [a, b] \rightarrow M$  in the space of all such maps with the same endpoints  $\gamma(a) = x_0$  and  $\gamma(b) = x_1$  satisfies the Euler-Lagrange equations

$$d_{(\gamma(t), \dot{\gamma}(t))} L_t \circ (d_{(\gamma(t), \dot{\gamma}(t))} \pi)^{-1} - \nabla_{\frac{d}{dt}}^{\gamma} (d_{(\gamma(t), \dot{\gamma}(t))}^{\vee} L_t) = 0.$$

*Remark:* Notice: Both terms depend on the auxiliary connection  $\nabla$  chosen, their difference, however, does not. (Exercise: Show this directly without referring to the fact that these equations describe the critical points of a functional which is defined without reference to  $\nabla$ )
